CMOS Analog Switches

(Obsolete for non-hermetic. Use DG304B Series as pin-for-pin replacements.)

FEATURES

- $\pm 15\text{-V}$ Input Range
- Fast Switching— t_{ON} : 110 ns
- Low $r_{DS(on)}$: 30 Ω
- Single Supply Operation
- CMOS Logic Levels
- Micropower: 30 nW

BENEFITS

- Full Rail-to-Rail Analog Signal Range
- Low Signal Error
- Wide Dynamic Range
- Low Power Dissipation

APPLICATIONS

- Low Level Switching Circuits
- Programmable Gain Amplifiers
- Portable and Battery Powered Systems

DESCRIPTION

The DG304A_MIL through DG307A_MIL series of monolithic CMOS switches were designed for applications in communications, instrumentation and process control. This series is well suited for applications requiring fast switching and nearly flat on-resistance over the entire analog range.

applications, without sacrificing switching speed. Break-before-make switching action is guaranteed, and an epitaxial layer prevents latchup. Single supply operation (for positive switch voltages) is allowed by connecting the V– rail to 0 V.

Designed on the Vishay Siliconix PLUS-40 CMOS process to achieve low power consumption and excellent on/off switch performance, these switches are ideal for battery powered

Each switch conducts equally well in both directions when on, and blocks up to the supply voltage when off. These switches are CMOS input compatible.

FIGURE 2. Switching Time

The timing diagram shows two signals over time. The top signal, \$V_O\$, starts at a low level, rises sharply to a higher level labeled \$\Delta V_O\$, and then returns to the low level. The bottom signal, \$I_{Nx}\$, starts at a high level labeled "ON", drops sharply to a low level labeled "OFF", and then returns to the high level. The rising edge of \$V_O\$ occurs while \$I_{Nx}\$ is transitioning from ON to OFF. Below the diagram, the equation \$Q = \Delta V_O \times C_L\$ is shown.
